| <p>Walton Electric Control Box Systems: Various systems used in rapid transit applications use the following concepts:</p> <p>Fixed extended pilot pins and regular system pins are individually spring loaded and make direct butt contact on flat front faces;</p> <p>All contacts are silver plated over a brass type conductor; Internal wiring is direct bolt/nut to rear of contact pins</p> <p>Fixed extended pilot pins make basic contact to energize the control system (at first coupling).</p> <p>Control system supplies air to piston and rubber diaphragm (in electric box) to extend the contact block (with the remaining system pins) into the forward engaged position.</p> <p>To disengage, the control system releases air from the piston and a spring system retracts the contact block.</p> | <p>** A basic design problem to be faced is that of the ability of the coupler gathering systems to absorb the impact and misalignment energies so the electrical box experiences only direct in-line movements and minimal impact forces.</p> <p>- Individual spring loading is needed to compensate for variations in contact block flatness.</p> <p>** Some amount of contact rotation would seem desirable to make the best electrical connection.</p> <p>** For long-range maintenance, replaceable silver contact tips would be desirable.</p> <p>- Good system continuity would require all supporting contacts to be bolt/nut or compression threaded type.</p> <p>** Since good electrical contact of the pilot pins is essential for the control system to operate, these circuits should be redundant.</p> |

WALTON ELECTRICAL CONTROL BOX SYSTEMS (CONT'D.)

Manual extension/retraction is possible by use of a self-contained hand crank.

(1) Side mounted (with swing type cover).

- Cover is attached to extended radius spring loaded mounting arms and has cam shaped front with a guide arm facing forward and outward.
- As the couplers come together, the contact of the opposing cam shaped covers results in a wedging action which forces the opposing covers to swing to the outside, exposing the electrical contacts.

(2) Lower mounted (with track type cover).

- The cover rides in a recessed track running beneath the electric box and is spring loaded in the closed position.
- A horizontal push bar is compressed approximately 1-1/2 inches by a similar unit on the opposing

\*\* The use of a rubber diaphragm may present some problems with leakage from cracks brought on by age embrittlement.

- Since the entire piston/diaphragm system is enclosed in the electrical box, environmental grime problems should be negligible.

- Should be reliable for efficient contact disengagement.

- Good back-up in case of a system malfunction.

\*\* The guide arm should be of massive design since it must take the initial impact and stress before the cover starts to move.

\*\* The covers are required to lever each other aside while in full contact. This would seem to place undue stress on the mounting points due to the sliding friction between covers. It would seem that easier opening would be achieved by having total opening forces applied

WALTON ELECTRICAL CONTROL BOX SYSTEMS (CONT'D.)

coupler. The rearward movement of this bar is transmitted through a rack and pinion gear to pull the cover down and under the box (following the recessed track).

(3) No cover.

- A rubber gasket is fitted around the contact block to provide a tight seal between opposing electrical boxes when coupled.

(4) Plastic covers are applied to the facing surfaces of the metal covers to protect the fixed extended pins from accidental short circuit in the event of a bent or damaged cover assembly.

to the guide arm which would have a better lateral force moment.

- \*\* The recessed track would have a high probability of clogging up with grime or ice, thus blocking the path needed for cover movement.

- \*\*The push bar runs the full width of the electric box (and coupler). There is a high probability of an impact on one edge during any wide angle coupling. The bar (and its sliding push rod mechanism) would have to be extremely strong to withstand the resulting lateral forces while still compressing equally on both sides as needed for proper opening of the door.

- The use of a sealing gasket seems most desirable for all electrical contact units with or without covers.
- Detachable plastic insulating covers would be practical and desirable for the inside surface of electrical

# Concept 611: RETRACTABLE TRAINLINE CONNECTOR

Primary Bibliography Reference No.: 611

Related Reference Number(s) 502

## Description of Concept

- Retracted when not connected
- Cover is optional
- Lugs support the device without tilting
- Stop ring limits forward travel; compression spring to maintain connection

## Compatibility with AAR Type "E" Coupler:

|                                       |   |
|---------------------------------------|---|
| 1. Can be added to Type "E"           | X |
| 2. Requires modification of Type "E"  |   |
| 3. Requires head adapter for Type "E" |   |
| 4. Incompatible with Type "E"         |   |

## CATEGORY I - IMPROVE TRAIN AIR-LINE SYSTEM

### Pertinent Functions:

| Description of Concept - Side of car operated telescoping rods extend for universal connections on ball valve to adjacent ends of car<br>- May be actuated from either side of car<br>- Ball valve to control airflow |                                                                                                                        |
| Compatibility with AAR Type "E" Coupler:                                                                                                                                                                              |                                                                                                                        |
| 1. Can be added to Type "E"                                                                                                                                                                                           | X                                                                                                                      |
| 2. Requires modification of Type "E"                                                                                                                                                                                  |                                                                                                                        |
| 3. Requires head adapter for Type "E"                                                                                                                                                                                 |                                                                                                                        |
| 4. Incompatible with Type "E"                                                                                                                                                                                         |                                                                                                                        |
| CATEGORY I - IMPROVE TRAIN AIR-LINE SYSTEM                                                                                                                                                                            |                                                                                                                        |

| Description of Concept - Extensible pneumatic piston and cylinder assembly, one part is attached to the main body of the coupler; the other part is operally connected to the operating mechanism of the coupler knuckle.<br><br>- Bleeding of the cylinder and piston assembly is effected through a pneumatic time delay circuit. |                                                                                                                              |
| Compatibility with AAX Type "E" Coupler:                                                                                                                                                                                                                                                                                            |                                                                                                                              |
| 1. Can be added to Type "E"                                                                                                                                                                                                                                                                                                         | X                                                                                                                            |
| 2. Requires modification of Type "E"                                                                                                                                                                                                                                                                                                |                                                                                                                              |
| 3. Requires head adapter for Type "E"                                                                                                                                                                                                                                                                                               |                                                                                                                              |

# Concept 682: AUTOMATIC COUPLING SYSTEM FOR TRAIN BRAKE LINES

Primary Bibliography Reference No.: 682

Related Reference Number(s) 517

Description of Concept - Attached to coupler below coupler head

- Air coupler on rubber grommet which couples and uncouples simultaneously with mechanical coupling or uncoupling - pilot valves control air.
- Gathering wings facilitate connection.

Compatibility with AA Type "E" Coupler:

|                                       |   |
|---------------------------------------|---|
| 1. Can be added to Type "E"           | X |
| 2. Requires modification of Type "E"  |   |
| 3. Requires head adapter for Type "E" |   |
| 4. Incompatible with Type "E"         |   |

| <p>Description of Concept Consisting of a dual probe/funnel air connection system mounted side-by-side above the coupler head such that the probe "floats" in a "U" shaped mounting and the mating funnel is solidly mounted to the coupler head. The system operates as follows:</p> <ol style="list-style-type: none"> <li>1. Coupler guides the probe into basic alignment and the funnel completes the gathering.</li> <li>2. The probe operates a quick disconnect valve to open its air line with interconnecting air pilot lines.</li> <li>3. Unintentional uncoupling results in operating of the valves through a spring bias system to set the emergency brake system.</li> </ol> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Compatibility with AAR Type "E" Coupler:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Description of Concept                                                                                                                                              |                                                                                                                                                                                       |
| Adaptation of "E" double-shelf coupler (Ref. No. 54) by adding guard arm extension faces at top and bottom of side shelf supports to achieve fixed gathering wings. |                                                                                                                                                                                       |
| Compatibility with ARM Type "E" Coupler:                                                                                                                            |                                                                                                                                                                                       |
| 1. Can be added to Type "E"                                                                                                                                         | X                                                                                                                                                                                     |
| 2. Requires modification of Type "E"                                                                                                                                |                                                                                                                                                                                       |
| 3. Requires head adapter for Type "E"                                                                                                                               |                                                                                                                                                                                       |
| 4. Incompatible with Type "E"                                                                                                                                       |                                                                                                                                                                                       |
| CATEGORY I - IMPROVE TRAIN AIR-LINE SYSTEM                                                                                                                          |                                                                                                                                                                                       |

# Concept 705: HOOK COUPLER

Primary Bibliography Reference No.: 705

Related Reference Number(s) 502

Description of Concept - Spring based coupling hook

- Adapted for interlocking engagement
- Inboard projections and tapered hook facilitate gathering

Compatibility with AAR Type "E" Coupler:

- |                                       |   |
|---------------------------------------|---|
| 1. Can be added to Type "E"           |   |
| 2. Requires modification of Type "E"  |   |
| 3. Requires head adapter for Type "E" |   |
| 4. Incompatible with Type "E"         | X |

Concept 740: COUPLER TO REPLACE HOOK OR SCREW COUPLER

Primary Bibliography Reference No.: 740

Related Reference Number(s) 501

Description of Concept - One piece casting

- Pivotal gathering wings disposed at a 45° angle from a horizontal plane.
- Head at one end of the shank provided with upper and lower sections defining a throat.

Compatibility with AAR Type "E" Coupler:

1. Can be added to Type "E"
2. Requires modification of Type "E"
3. Requires head adapter for Type "E"
4. Incompatible with Type "E"

- Lock mounted in upper section latch on one gathering wing.

Concept 891: COUPLER KNUCKLE STRUCTURE  
Primary Bibliography Reference No.: 891

Related Reference Number(s) 501

Description of Concept - Knuckle coupler with gathering surfaces.

Compatibility with AAR Type "E" Coupler:

- |                                       |   |
|---------------------------------------|---|
| 1. Can be added to Type "E"           |   |
| 2. Requires modification of Type "E"  | X |
| 3. Requires head adapter for Type "E" |   |
| 4. Incompatible with Type "E"         |   |

| Related Reference Number(s) 502                                                                                                                                           |                                      |
| Description of Concept - "F" coupler hood which overlies the knuckle - receiving recess of the "F" coupler to afford vertical interlock when coupled with an "E" coupler. |                                      |
| Compatibility with AAR Type "E" Coupler:                                                                                                                                  |                                      |
| 1. Can be added to Type "E"                                                                                                                                               | <input type="checkbox"/>             |
| 2. Requires modification of Type "E"                                                                                                                                      | <input type="checkbox"/>             |
| 3. Requires head adapter for Type "E"                                                                                                                                     | <input type="checkbox"/>             |
| 4. Incompatible with Type "E"                                                                                                                                             | <input type="checkbox"/>             |

| Description of Concept - A Brush apparatus located alongside the track which provides the traditional manual function of pulling the lever to uncouple knuckle couplers |     |
| Compatibility with AAR Type "E" Coupler                                                                                                                                 |     |
| 1. Can be added to Type "E"                                                                                                                                             | N A |
| 2. Requires modification of Type "E"                                                                                                                                    |     |
| 3. Requires head adapter for Type "E"                                                                                                                                   |     |
| 4. Incompatible with Type "E"                                                                                                                                           |     |
| CATEGORY I - IMPROVE TRAIN AIR LINE SYSTEM                                                                                                                              |     |

| Description of Concept                                                                                                                                                                                                                                                                                                                 |   |
| Control system consists of a locomotive control box (car selector switch, rotary self-interrupting stepping switch, relays and operating switches), four individual circuit wires between cars and individual car control boxes (two stepping relays and two coupler unlatching solenoids);                                            |   |
| Compatibility with AAR Type "E" Coupler:                                                                                                                                                                                                                                                                                               |   |
| 1. Can be added to Type "E"                                                                                                                                                                                                                                                                                                            | X |
| 2. Requires modification of Type "E"                                                                                                                                                                                                                                                                                                   |   |
| 3. Requires head adapter for Type "E"                                                                                                                                                                                                                                                                                                  |   |
| 4. Incompatible with Type "E"                                                                                                                                                                                                                                                                                                          |   |
| CATEGORY I - IMPROVE TRAIN AIR-LINE SYSTEM                                                                                                                                                                                                                                                                                             |   |

| *IVC.                                                                                                                                                                                                                                                                                                                                  |   |
| - Compatible as part of add-on control system.                                                                                                                                                                                                                                                                                         |   |
| - Feasible control system if: (1) electric intercar connection system available, (2) electric solenoids are available with capacity to meet force required to operate uncoupling valves while being sensitive enough to react to control pulses and (3) relay and stepping switches which are reliable under the required environment. |   |
| - Remote uncoupling will improve reliability.                                                                                                                                                                                                                                                                                          |   |

Notes: \*This concept embodies improvements in this function.  
 \*\*Denotes potential operating or safety problem.

# Concept 1046: FLUID OPERATING UNCOUPLING MECHANISM

Primary Bibliography Reference No.: 1046

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                             |                                            |   |                                            |                                                                                                                                             |          |                                            |                                       |                                                                                                  |           |                               |          |  |         |  |       |  |      |  |      |  |      |  |     |  |

| Description of Concept                                                                                                                                                                                                                                                                                                        |                                            |
| <ul style="list-style-type: none"> <li>- Electromagnet at outer end of a piston rod of a double acting pneumatic cylinder</li> <li>- Electromagnet coupling a car to an armature of an adjoining car</li> <li>- Pneumatic cylinder serves to absorb the shock of the coupling impact and to draw the cars together</li> </ul> |                                            |
| Compatibility with AAL Type "E" Coupler:                                                                                                                                                                                                                                                                                      |                                            |
| 1. Can be added to Type "E"                                                                                                                                                                                                                                                                                                   | <input type="checkbox"/>                   |
| 2. Requires modification of Type "E"                                                                                                                                                                                                                                                                                          | <input type="checkbox"/>                   |
| 3. Requires head adapter for Type "E"                                                                                                                                                                                                                                                                                         | <input type="checkbox"/>                   |
| 4. Incompatible with Type "E"                                                                                                                                                                                                                                                                                                 | <input type="checkbox"/>                   |

## Primary Bibliography Reference No.: 1150

**Novelty of concept** Figure 1 shows the novel concept of the proposed system. The system is designed to be a self-learning system that can learn from the user's feedback and improve its performance over time. The system is designed to be a self-learning system that can learn from the user's feedback and improve its performance over time.

1 Can be added to Page 1  
2 Requires modification of Page 1  
3 Requires new sample for Page 1  
4 Incompatible with Page 1

| Description of Concept                       | Coupler self-centering device utilizing the buffing force of the draft gear return spring to apply bias force to lateral extended bearing surfaces on the shank butt. Lateral movements of the shank cause the bearing forces to shift from the normal spherical mating surfaces (matched between butt and yoke) to the lateral lips on the butt and yoke. The return spring applies the bias force to the shank to aid centering. |
| Compatibility with AAR Type "E" Coupler:     |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 1. Can be added to Type "E"                  | X                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2. Requires modification of Type "E"         |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3. Requires head adapter for Type "E"        |                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| IIA3.                                        | - Self centering would be effective for recentering of lateral movements (beyond a designed "free force" center range). Greater buff forces (i.e., during emergency stops) would result in greater centering forces; therefore, reducing contour angling tendency the greatest under emergency stop conditions.                                                                                                                    |

| Description of Concept                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                |
| <p>Wabco air connector with electrical contactor (automatically positioned by air connector unit - such as Ref. 511b - and electrical contacts moved into or from mating position by following sequences:</p> <ol style="list-style-type: none"> <li>1. Seating of guide arm operates a valve in mating connector.</li> <li>2. Valve channels air line pressure (as quickly as available) to actuate a piston.</li> <li>3. Piston thrusts the clustered contact pins forward into mating position.</li> <li>4. Release of air pressure allows contacts to disengage from return spring pressure.</li> </ol> |                                                                                                                                                                                                |

| IVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                |

Notes: \*This concept embodies improvements in this function.  
 \*\*Denotes potential operating or safety problem.

### C.3 DATA ACCUMULATION FORM

#### SIGNIFICANT COUPLER CONCEPT DATA

##### GENERAL SUMMARY

- 1) Concept Description and Model No. \_\_\_\_\_
- 2) Manufacturer \_\_\_\_\_
- 3) State of concept development (check as applicable)
  - (a) Conceptual (pat. pen.) \_\_\_\_\_
  - (b) R & D Phase Complete \_\_\_\_\_
  - (c) Engineering prototype tested \_\_\_\_\_
  - (d) Field test completed \_\_\_\_\_
  - (e) Ready for pilot production \_\_\_\_\_
  - (f) In production \_\_\_\_\_
- 4) Environmental limitations (list differences from "E" coupler capabilities for: temperature, dirt or dust, vibration or impact damage susceptibility etc.) \_\_\_\_\_
- 5) Compatible with AAR type "E" coupler system? \_\_\_\_\_
- 6) Estimates of costs (based on 1975 dollars).
  - (a) Cost \$\_\_\_\_\_ and time \_\_\_\_\_ (months) to bring the concept up to a state of "ready for pilot production"
  - (b) System purchase price \$\_\_\_\_\_ (based on \_\_\_\_\_ units/year)
  - (c) System installation costs for: New construction \$\_\_\_\_\_ and retrofit on old cars \$\_\_\_\_\_ (cost/car)
  - (d) System maintenance \$\_\_\_\_\_ (est. average maintenance cost per year - annualized over first 10 years)
- 7) Summary of Functional Characteristics (attach detail data sheets.

| 501 | American Steel Foundry<br>1005 Prudential Plaza<br>Chicago, Illinois<br>(312) 644-4080 |
|-----|----------------------------------------------------------------------------------------|

Interview discussions included centering and positioning device issues, coupler modifications to increase the gathering range, and general research and development activities in the railroad industry.

Efforts to increase the coupler gathering range consist of changing the contour of the coupler knuckle, knuckle location and guard arm location.

The impact of mass transit couplers and proprietary couplers used on unit trains and in dedicated service was also discussed.

|     |                                                                                                                         |

were discussed, because the device is still in the prototype stage, exact costs could not be quoted.

A contract was granted to National Castings in conjunction with European firms for conversion to the Willison (UIC) coupler. Characteristics of the coupler were explained and related to the "E" and "F" couplers.

Other National Castings activities and interests include knuckle contour modification, coupler strength enhancement, slack reduction, and locking and lock set.

|     |                                                                                                                                                   |

|-----|---------------------------------------------------------------------------------------------------------------------------------------------------|

A review was made of the current and past activities on the part of Ohio Brass in the area of railroad and mine car couplers. The type of designs which were reviewed include rigid, flat faced, matching horn/funnel, hinged hook type couplers, rigid, nonreversible type, male/female couplers, coupler location control systems, and coupler electrical systems.

connectors are not defined at this time, however, they are expected to be a slight modification of connectors used in the Southern Railroad "auto-guard" car. Generally, these would be eight-foot long tubular draw bars with service shank pins.

505                      Canadian Steel Foundries  
                         Division of Hawker Siddley  
                         Canada, Ltd.  
                         P. O. Box 80  
                         Montreal, Quebec    HIU 3L7  
                         (514) 255-4041

Canadian Steel Foundries, a coupler manufacturer for the rail freight industry, is a division of National Castings. Accordingly, all coupler work related to research and development is conducted by National Castings under the direction of Mr. Damiano Albanese.

506                      Hawker Siddley Canada, Ltd.  
                         Thunder Bay, Ontario  
                         (807) 577-8431

Hawker Siddley, a major manufacturer of mass transit railcars, does not develop nor manufacture couplers for their mass transit cars. Instead, coupling systems, as specified by the mass transit users, are subcontracted out to either Waugh (Dresser), WABCO, or Ohio Brass. Thus, information regarding mass transit couplers and their components used by Hawker Siddley can be obtained only from these subcontractors.

507                    Stanray Corporation  
                      Standard Railway Equipment Division  
                      4527 Columbia Avenue  
                      Hammond, Indiana 46320

Stanray's primary involvement with coupler systems focuses on centering devices and coupler release rods.

Their current centering devices use leaf spring and single spring principles. The devices are usually installed on new cars rather than retrofit. The expected life of a centering device is eight years.

Two primary problems identified with centering device utilization is force and friction moving the coupler to center. The primary advantage gained in using centering devices is a reduction in end of car damage due to by-passed couplers..

508                    Holland Company  
                      747 East Roosevelt Road  
                      Lombard, Illinois 60148

The Holland Company has developed and at one time marketed a coupler positioning device. The functions of the positioning device were explained in detailed and operations were demonstrated through several films.

Economic issues were presented including purchase, installation, and maintenance estimates.

511                    Railroad Products Marketing  
                      WABCO - Westinghouse Air Brake Company  
                      Wilmerding, Pennsylvania 15148

Bibliography

Industry Interviewed

The WABCO N2 and N2A mass transit couplers were discussed in detail. Specific issues pursued were the construction and repair of the devices, pneumatic coupler operation, and the use of centering devices.

An automatic air connector to be used in conjunction with National Casting's "Compatimatic" was explained. Conceptually, the devices would supplement the current air line system to provide compatibility for cars not equipped with the device.

Potential for electrical connections in freight service was discussed in light of current WABCO research and development activities.

513                    Dominion Foundries and Steel Ltd.  
                      P.O. Box 460  
                      Hamilton, Ontario  
                      Canada LBN 3J5

DOFASCO manufactures couplers to design specification, but has no coupler research and development activity. Accordingly, interview topics centered upon coupler manufacturing considerations - casting and machining components and strength of materials issues.

514                    New York Air Brake  
                      Starbuck Avenue  
                      Watertown, New York 13601

New York Air Brake develops and manufactures braking systems for passenger, rapid transit, and freight trains. End of car equipment reviewed during the plant visit was brake pipes, angle

cocks, and air hoses. Considerations for including electrical connections within the freight air line system appears reasonable with NYAB developments.

This company is expanding the rapid transit business through import of a German coupler - the BSI coupler. Air system simulators and an operational model of the BSI coupler were available for demonstration.

515                      Freight Master  
                         P.O. Box 40555  
                         Ft. Worth, Texas 76140

The primary railroad product manufactured by Freight Master is the hydraulic end-of-car cushioning device.

Interview commentary included an explanation of the use of the devices, cost, installation, and maintenance considerations. Of particular interest were the special modifications affecting air systems and coupling systems such as special glad hand travels with some units.

516                      Walton Products  
                         868 Sussex Boulevard  
                         Broomall, Pennsylvania 19008

The Walton Electro-Pneumatic Coupling System and the Walton electrical system for rapid transit couplers were presented. The discussions included detail related to design considerations and operating characteristics of the coupler and electrical systems.

A model was available for demonstration purposes.

517                    Dresser Transportation Equipment  
                      Two Main Street  
                      Depew, New York 14043

Dresser manufactures both freight and rapid transit couplers and conducts research and development activities related to coupling systems. Several models are displayed for demonstration purposes.

In addition to the couplers, concepts behind the development efforts for their automatic trainline connector and their positioning device were reviewed.

551                    San Francisco Bay Area Rapid Transit  
                      800 Madison Street  
                      Oakland, California 94615  
                      (415) 465-4100

Operating characteristics of the current BART system couplers were presented from the users viewpoint. Problems with the coupler system were identified with the electrical system, the draft gear, and springs. In relating the BART coupler system to its potential for freight service, coupler strength was considered the major issue.

552                    Cleveland Transit System  
                      3420 East 93rd Street  
                      (216) 781-5000

The Cleveland Transit System coupler use and related problems were reviewed. Problems confronting the system are damage to electrical components upon coupling and ice and snow effects.

553                    Southern Railway  
                      409 Henry Street  
                      Alexandria, Virginia

Knuckle failure was identified as a major problem with "E" couplers particularly with high load unit trains. Other problems are draft gear and yoke related and air hose connections and leakage.

It was felt that air connection enhancements should be given top priority for improving the overall freight coupling system.

554                    New York City Transit Authority  
                      370 Jay Street  
                      Brooklyn, New York 11201

The New York City Transit Authority has approximately seven thousand cars in service. The mechanical portion of the coupler presents no operational nor maintenance problems. The only suggestion for improving the coupling system was enhancing the electrical system possibly through the use of multiplexors.

555                    Chicago Transit Authority  
                      Chicago, Illinois  
                      (312) 664-7200

The Chicago Transit Authority uses couplers supplied by Ohio Brass. It was felt that the manufacturer could provide information pertinent to this study.

- 556                    Atchison, Topeka and Santa Fe Railroad Co.  
                      80 East Jackson Boulevard  
                      Chicago, Illinois 60604  
                      (312) 427-4900

Problems with "F" couplers were identified as weak pin connection causing coupler detachment and potential for derailment and jackknifing in buff compression. "E" couplers cannot hold a broken mated coupler, has considerable wear potential, and considerable slack.

The use of the "Compatimatic" device and positioning devices were discussed in addition to potential for automatic air connections and electrical lines for freight service.

- 557                    Washington Metropolitan Transit Authority  
                      600 Fifth Street, N.W.  
                      Washington, D.C.  
                      (202) 637-1234

Washington Mass Transit Authority has a unique remote coupling capability on their system. The primary problem experienced with their coupling process is by-passed couplers and coupler alignment.

- 558                    Toronto Area Transit Operating Authority  
                      3625 Dufferin Street  
                      Downsview, Ontario M3K 1C2

Toronto Area Transit Operating Authority currently uses "H" couplers on their passenger trains. Because an objective is to

Bibliography

Industry Interviewed

reduce manual effort required in coupling operations they are evaluating new couplers for future installation.

Problems confronting them were reviewed and include slack action, power cable flexing, and flexing and worn air hoses.

559                    Canadian National Railways  
                      935 Lagauchetiere Street, West  
                      Montreal, Quebec, Canada H3C 3N4

The primary problem experienced with the freight couplers on the Canadian National Railways system is knuckle breakage and long cars are highly subject to miscoupling damage.

Center devices have been used successfully on the cars to reduce the incidence of by-passed couplers.

Potential for electrical system installation in freight service was reviewed and endorsed.

## APPENDIX F

### REPORT OF INVENTIONS

This report, a survey and assessment of automatic coupling concepts for rail freight cars, includes as Appendix C a previously unavailable listing and categorization of automatic coupling concepts. Section 5 provides estimated quantitative values of improvement in coupling systems from each concept. Cost estimates for candidate coupling systems composed of various concepts are found in Section 6 and they represent a new contribution.

## APPENDIX G

### PRELIMINARY DEVELOPMENT SPECIFICATION FOR AUTOMATIC TRAIN AIR LINE CONNECTOR

#### A.1 GENERAL PROVISIONS

1) Installation of the connector to the car must be possible with the coupler in place. Mounting must not interfere with existing car components (including hydraulic cushioning devices on long cars).

2) Connector must be suitable for mounting on both Type "E" and "F" couplers (including a double-shelf "E" coupler and a top shelf "F" coupler).

3) Replacement of damaged connector, or components, must be accomplished with a minimum of time and with no special tools.

4) Connector mounted to a car must not exceed clearance limits and must operate satisfactorily at the track curvature limits specified for freight cars in the AAR Manual of Standards and Recommended Practices. (Section C, pages C-4-1968 through C-7-1968, and in the AAR Specifications for Design, Fabrication and Construction of Freight Cars.) Connector must not restrict air flow through the brake pipe at the limits specified.

5) Connector must allow making a manual brake pipe connection from the connector face to a car having standard air brake hose.

6) Connector must be suitable for freight car service between temperatures of -50°F to 200°F.

7) Connector must not normally require periodic attention except for replacement of hose coupling gasket and hose.

8) Connector must operate within a pressure range of 0 to 150 psi.

9) Cost objectives must be compatible with satisfactory operating requirements.

10) Connector design shall provide space for a mechanical push-rod which is depressed by the full closure of the butt seal. (This push-rod will be incorporated as a part of a separate air valve control mechanism.)

## A.2 CONNECTION PROVISIONS

1) Connector concept must be suitable for installation of one air line and six to eight electrical contacts placed on the centerline below the air line port. (The electrical contacts can be contained in a separate detachable unit which could be securely attached as a later modification to the air connector unit.)

2) The basic connector design shall be "spread-wing" which will include the capability of subsequent design modifications to increase gathering capability while remaining compatible with original designs.

3) Connector must have the capability of gathering (a) horizontally, with the distance between the connector centers a maximum of  $\pm 5"$ , (b) vertically, with the distance between connector centers a maximum of  $\pm 5"$ , and (c) when the horizontal angle between connector center lines is a maximum of 17 degrees.

4) Connector must not be damaged by coupler by-pass or mis-couplings.

5) Connector should incorporate self-centering means to assure that the connector is on coupler center in an uncoupled position.

6) Connector should have a minimum number of parts, minimum amount of machining, be compact, sturdy and lightweight design in order to meet economic and serviceability/requirements.

7) Connector must permit necessary operations to be performed from either side of the car.

8) Connector shall incorporate a spring type self-loading capability having a thrust of at least 500 pounds force and a free longitudinal compression travel of at least 1-1/2 inches.

### A.3 AIR LINE PROVISIONS

1) The airline port shall be butt faced and shall include a compressible outer seal providing for at least 1/4 inch compression.

2) Car angle cock location to be maintained within present location as specified by AAR. (Manual of Standards and Recommended Practices, Section E, Pages E-31-1965 to E-33-1965.) However, design provisions shall be made for location of a second angle cock as may be required for use in coupling with a nonequipped car.

3) Air brake hose attached to connector must be removable without uncoupling cars. It must be possible to make the Single Car Test without uncoupling cars.

4) Connector must operate without leakage under worn coupler condemning gage limits and with maximum vertical distance between coupler center lines of 8-1/4". (Displacement for vertical curve negotiation of 7-1/4" is required by AAR Specification Design, Fabrication and Construction of Freight Cars 2.6.)

5) Use of standard air hose gasket is desirable, but not required. (AAR Manual of Standards and Recommended Practices, Section A, Page M-602-63.) Use of present standard air brake hose length of 22" is preferred, but not required.

6) Coupled connectors, with hoses, must have air flow capacity equivalent to at least a 0.984" diameter square edged, 1/16" thick, orifice.

7) The brake pipe opening at the gasket face of the connector must be the lowest point in the brake pipe line to permit draining of water from the brake pipe and there must be a continuous drop from the angle cock to the connector coupling gasket to prevent water pockets.
